The present sequence represents a human preptin peptide. The peptide corresponds to Arg69-Leu102 of the proIGF-II E peptide. Preptin is secreted by pancreatic islet beta-cells which enhances glucose-mediated insulin secretion. Preptin peptides and their analogues are useful in preparing medicaments for preventing or treating a condition which results in or involves deficient insulin synthesis, secretion or action e.g. type II diabetes. Antibodies specific to preptin peptides are useful in an immunological assay such as radioimmunoassay (RIA), IRMA (undefined) or Enzyme linked immunoabsorbant assay (ELISA) for

New mammalian peptide with preptin functionality, useful for preventing or treating Type 2 diabetes mellitus by stimulating insulin secretion.

preptins (ADM35841-ADM35843), preptin analogues, preptin agonists or salts or derivatives thereof. Preptins are able to stimulate the proliferation and differentiation of beta-cells and fibroblasts. Preptin approists, their salts and derivatives are useful in the treatment of internal or external injuries or wounds (e.g., burns, ulcers, surgical wounds or mucous membrane disruption); conditions characterised by decreased beta-cell mass or number; beta-cell mediated diseases (e.g., type 1 or type 2 diabetes); and conditions characterised by insulin resistance, undesirably low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    peripheral nervous system injury; Alzheimer's disease;

They are additionally useful for increasing or maintaining beta-cell mass or beta-cell number; for stimulating beta-cell poroliferation via cell differentiation or neogenesis; for increasing type cell mass via cell differentiation or neogenesis; for decreasing type functional recovery of damaged sciation neces; preventing peripheral motor paralysis during or as a result of chemotherapy; and for improving myocardial function. The present sequence represents human preptin, which is specifically claimed for use in the method of the invention.

This invention relates to a novel method for treating a bone condition. Specifically, it refers to increasing or maintaining bone density, stimulating osteoblast growth, or modulating osteoblast apoptosis. The present invention comprises administering preptin, a preptin analogue or agonist thereof, which corresponds to residues Asp-69 to Leu-102 of the proinsulin-like growth factor II that is co-secreted with insulin from pancreatic islet beta cells in response to glucose. Accordingly, such compositions that exhibit osteopathic activities can be used to treat or

The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidy) and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity in CC vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent CC administration due to rapid degradation by peptidases in the body. CC Modifying and attaching therapeutic peptides to albumin prevents or creduces the action of peptidases to increase length of activity (half CC intracellular uptake and interference with physiological processes. CC ABB90829 to ABB2441 represent peptides which can be used in the CC exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to polynucleotide and polypeptide sequences for a novel insulin homolog referred to as Zins3. The polynucleotide sequences encoding the Zins3 polypeptides are located on chromosome 12. The present invention also includes antibodies to the Zins3 polypeptides. The Zins3 polypucleotide and polypeptide sequences of the invention are useful for identifying and isolating receptors involved in growth and differentiation of Zins3 responsive cells. This sequence represents human insulin growth factor 2 (IGF2) that shows homology to human Zins3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 35

Protease-hydrolysed polypeptide #69

```
CC for a target substrate for preparing a medicament for the treatment of a specific disease related to the target substrate. The invention also CC relates to a pharmaceutical or diagnostic composition comprising one or CC more enzymes in the use cited, optionally comprising pharmaceutically or CC diagnostically acceptable carriers, excipients and/or auxiliary agents, a CC method for cleaving a target substrate in vivo or in vitro comprising CC contacting the target substrate in vivo or in vitro comprising CC contacting the target substrate of a disease in a patient connected with a specific target substrate comprising administering to the patient CC with a specific target substrate administering to the patient CC a protease with defined specificity for the specific target substrate. CC one or more biological activities, physico-chemical properties or reduces or pharmacological properties of the target protein and/or activates or pharmacological properties of the target protein, and/or adds one or comparities, physico-chemical properties or pharmacological activities, physico-chemical properties or comparity diseases, dermatological diseases, gastrointestinal conscious contactive diseases, metabolic diseases, gastrointestinal conscious properties of the target protein. The protease may be administered to treat immune disorders, inflammatory diseases, candornative diseases, growth disorders, mutritional disorders and infections. This secuence represents a nolvmentide hydrolysed by a factor of the carget protein and/or adds one or conscious diseases, gastrointestinal conscious diseases, gastrointestinal conscious conscious diseases, gastrointestinal diseases, gastrointestinal diseases, gastrointestinal diseases, gastrointestinal diseases, gastrointestinal diseases, gastrointestinal diseases, gastrointestide hydrolysed by a protein properties of the target protein.
                                                                                                                  Query Match

03-OCT-2002
31-JUL-1991
                                                                                                                                                                                                                                                                       The sequence is human prepro-insulin-like growth factor-2. DNA probes prepared against DNA encoding the protein sequence may be to detect the presence of the genes in a natural source. The probes may be used to detect mutations and/or deletions in humans suffering from growth deficiencies. See also AAN60489, AAN60490 (Updated on 03-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present cDNA sequence is Insulin-like growth factor II. This was selected as the second protein due to its binding affinity for IGFBP 6. The Renilla luciferase cDNA was fused to IGFBP 6 cDNA (insulin-like growth factor binding protein 6) and humanised GFP (green fluorescent protein) cDNA was fused to IGF-II (insulin-like growth factor II) cDNA. Living cells were transfected with the fused cDNAs and the fusion proteins were expressed. This is used in determining molecule interaction within a living cell by detecting any fluorescence resulting from luminescence resonance energy transfer from the donor luciferase

The method involves comparing CC the expression level of a marker in a patient sample and the normal level CC of expression of the marker in a control non-ovarian cancer sample, where CC the marker is selected from 363 cancer markers described in the CC characterising cancer, in detecting the presence of cancer as early as CC possible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing CC cancer). The cancer markers may be used in the management and treatment CC of e.g. brain and central nervous system disorders (e.g. brain and central nervous system disorders (e.g. brain CC cinflammations (e.g. bacterial or viral meningitis or encephalus or brain herniations), CC cinflammations (e.g. bacterial or viral meningitis or encephalitis), CC connective tissue disorders, or heart disorders (e.g. ischaemic heart classes or atherosclerosis). The compositions and methods may also be considered with assessing the historical type of nonlasm associated with

This is an example of a gene product that is differentially expressed in cancer cells relative to non-cancer cells, or between cancer cells of different malignant potential. Such genes, and their gene products, can be assayed in addition to tyrosine threonine kinase (TTK, see ABP54938), in methods of the invention for differential expression in a test cell. The invention for differential expression in a test cell. The various forms of cancer. Methods are provided for the identification of cancerous cells, especially breast cancer and colon cancer cells, by detection of expression levels of TTK, as well as diagnostic, prognostic and therapeutic methods based on differential expression. These methods can be used as the basis of rational therapy. Assays for identifying molecules that modulate the activity of these genes in cancers, as well as methods of inhibiting tumour growth by inhibiting the activity of TTK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Reducing growth of cancer cells comprises reducing Tyrosine Threonine Kinase (TTK) activity, useful in diagnosing and treating disorders with abnormal expression levels and activity of TTK, such as lung, colon,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for detecting a bladder cancer-
CC associated transcript in a cell from a patient. The method comprises
CC contacting a biological sample from the patient with a polynucleotide
CC that selectively hybridises to a sequence that is 80 % identical to a
CC encode the human bladder cancer-associated proteins given in ABR48146 to
CC ABR48242). Bladder cancer-associated sequences from the present invention
have cytostatic activities, and can be used in antisense gene therapy and
CC in vaccine production. The method can be used for detecting a bladder
CC cancer-associated transcript in a cell from a patient. The method is
CC useful in diagnosing or treating bladder cancer and in screening for
CC compounds that modulate bladder cancer, such as hormones or antibodies.
CC the nucleic acid molecules from the present invention may be used in
CC various screening and diagnostic methods, and for gene therapy, vaccine
CC and/or antisense/inhibition applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to targetted therapeutic comprising a therapeutic agent that is active in a mammalian lysosome, and a means for binding an extracellular domain of human cation-independent mannose-6-phosphate receptor in a mannose-6-phosphate independent manner. The invention is useful for treating metabolic diseases such as lysosomal storage disease, e.g. Gaucher's disease, Pompe's disease, Hurler's syndrome, Niemann-pick's disease, mannosidosis, fucosidosis, Schindler's disease, mucolipidosis, cystinosis, Batten's disease, prosposin, or infantile neuronal ceroid lipofiscinosis. The invention is also useful in gene therapy. The present sequence is human insulin-like growth factor 2 (IGF-II). This sequence is used in the exemplification of the invention

with an amount of an agent effective to reduce TTK polypeptide activity (CTMK polypeptide), an assay for identifying a candidate agent that reduces (CTMK polypeptide) in the presence of a candidate agent; and (ii) comparing (CTMK polypeptide) in the presence of a candidate agent (ii) comparing (CTMK polypeptide) in the presence of a candidate agent (ii) comparing (CTMK polypeptide) activity in the absence of the candidate agent (CTMK polypeptide) activity in the absence of the candidate agent (CTMK polypeptide) activity (comprising); (i) contacting a cancerous cell displaying elevated expression of a TTK-(CTMK polypeptide) activity (comprising); (i) contacting polymucleotide with a candidate agent, and (ii) determining the effect of the candidate agent on TTK polypeptide activity) and assessing (CTMC polymucleotide in a test cancer cell of a subject; and (ii) comparing a (CTMC polymucleotide) in a test cancer cell of a subject; and (ii) comparing a (CTMC polymucleotide) in a test cancer cell of a subject; and (ii) comparing a (CTMC polymucleotide) in a control non-cancer cell, where the level of expression of TTK encoding (CTMC polymucleotide) in a control non-cancer cell is indicative of the prognosis of the cancerous disease). The methods are useful for detecting cancer (other than ovarian cancer) in a subject, cativity and assessing the prognosis of a cancerous disease other than covarian cancer. The methods are also useful for determining the ability of a subject to respond to a particular therapy e.g. as a basis of cativity and assessing the prognosis of a cancerous disease other than cancer is a subject, and cancer cell and therapy. The present sequence represents another protein which is differentially expressed in cancer tissues, in this case human IGF2 (insulin-like growth factor)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              non-cancer cell, where an increase in the expression level of TTK protein or nucleic acid in the test cell compared to that in the normal cell, indicates the presence of cancer other than ovarian cancer. Also included are reducing growth of a cancerous cell (by contacting a cancerous cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               a subject, comprising comparing the expression levels of tyrouthreonine kinase (TTK, a mitotic checkpoint gene) polypeptide polynucleotide in a test cell obtained from the subject and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting cancer in a subject, by comparing expression levels of tyrosine threonine kinase polypeptide or polynucleotide in a subject cell and a normal cell, where an increase in the expression level in the test cell is indicative of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to detecting cancer (other than ovarian cancer) a subject, comprising comparing the expression levels of tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 64-65; 79pp; English

associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnosing ovarian cancer and in identifying and using agents and/or
targets that inhibit ovarian cancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
monitoring response to therapy, selecting patients for post-operative
chemocherapy or radiation therapy, in selecting mode of therapy,
and as vaccines. This sequence corresponds to one of the proteins used
for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient polynucleotide that hybridizes to an ovarian cancer gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         18-JUN-2001; 2001US-0299234P.

signal peptidase, probable TC0289 [imported] - Chlamydia muridarum (strain Nigg)
C;Species: Chlamydia muridarum, Chlamydia trachomatis MoPn
C;Date: 31-Mar-2000 #sequence_revision 31-Mar-2000 #text_change 09-Jul-2004
C;Accession: G81719
R;Read, T.D.; Brunham, R.C.; Shen, C.; Gill, S.R.; Heidelberg, J.F.; White, O.; Hickey, C.; Dodson, R.; Gwinn, M.; Nelson, W.; DeBoy, R.; Kolonay, J.; McClarty, G.; Salzberg
Nucleic Acids Res. 28, 1397-1406, 2000
A;Title: Genome sequences of Chlamydia trachomatis MoPn and Chlamydia pneumoniae AR39.
A;Reference number: A81500; MUID:20150255; PMID:10684935
A;Accession: G81719
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-627 <TETD
A;Cross-references: UNIPROT:09PL19; UNIPARC:UPI0000057881; GB:AE002296; GB:AE002160; NI

## Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new accession number.

If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

FUNCTION: The insulin-like growth factors possess growth-promoting activity. In vitro, they are potent mitogens for cultured cells.

IGF-II is influenced by placental lactogen and may play a role in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CAVPO
